

BOLTING TOOLS

BOLTING

THEORY

Function of Bolts and Nuts

Threaded fasteners are used across industry to assemble products ranging from pipelines to heavy-duty earth movers and from cranes to bridges and many more. Their principle function is to create a clamping force across the joint which is able to sustain the operating conditions without loosening.

Correctly tightened bolts make use of their elastic properties, to work well they must behave like springs. When load is applied, the bolt stretches and tries to return to its original length. This creates compressive force across the joint members.

Behavior of Bolts and Nuts

Elasticity is defined in Hooke's Law of physics: The stress in a bolt is directly proportional to its strain. The stress-strain of a bolt has an elastic range and a plastic range. In the elastic range Hooke's Law is true.

All of the elongation applied within the elastic range is relieved when the load is removed. The amount of elongation increases when more load is applied. When a bolt is stressed beyond its proof load (maximum load under which a bolt will behave in an elastic manner), the elastic elongation changes to plastic deformation and the strain will no longer be proportional to the stress.

Tightening Methods

Principally there are two modes of tightening: "Uncontrolled" and "Controlled".

Uncontrolled tightening

Uses equipment and/or procedures that cannot be measured. Preload is applied to a bolt and nut assembly using a hammer and spanner or other types of impact tools.

Controlled tightening

Employs calibrated and measurable equipment, follows prescribed procedures and is carried out by trained personnel.

There are two main techniques:

1. Torque tightening

Achieves preload in a bolt and nut assembly via the nut in a controlled manner using a tool.

2. Bolt tensioning

Achieves preload in a bolt and nut assembly by stretching the bolt axially using a tool.

Tensioning requires longer bolts, and a seating area on the assembly around the nut.

Manufacturer's rating of pressure and torque are maximum safe limits. Good practice encourages using only 80% of these ratings!

Torque Tightening

Torque tightening is the application of preload to a fastener by the turning of the fastener's nut. The force required to cause the nut to rotate is called the torque. It needs to overcome the friction in bolt and nut threads during tightening.

Turning movement

Torque Tightening and Preload

The amount of preload created when torqueing is largely dependant on the effects of friction.

Principally there are three different "torque components":

- Torque to stretch the bolt
- Torque to overcome the friction in bolt and nut threads
- Torque to overcome friction at the nut spot face (bearing contact surface)

$$\text{Preload(Residual load)} = \text{Applied Torque} - \text{Frictional Losses}$$

Lubrication Reduces Friction

Lubrication reduces the friction during tightening, decreases bolt failure during installation and increases bolt service life. Variation in friction coefficients affect the amount of preload achieved at a specific torque. Higher friction results in less conversion of torque to preload. The value for the friction coefficient provided by the lubricant manufacturer must be known to accurately establish the required torque value.

Lubricant or anti-seizure compounds should be applied to both the nut bearing surface and the male threads.

RICTION

Example of how a lubricant can reduce the effect of friction and convert more torque to bolt preload.

Torque procedure

When torqueing it is common to tighten only one bolt at a time, which can result in point loading and load scatter. To avoid this situation, torque is applied in stages following a prescribed pattern:

Breakout Torque

When loosening bolts a torque value higher than the tightening torque is normally required. This is mainly due to corrosion and deformations in the bolt and nut threads.

Breakout torque cannot be accurately calculated, however, depending on conditions it can take up to 2-1/2 times the input torque to breakout.

Square Drive Hydraulic Torque Wrench

Max working pressure : 700bar
Aluminum-titanium alloy material , compact structure
Conventional high power torque wrench

Characteristics:

- Working pressure 700 bar max.
- Designed to tighten and loosen nuts requiring high torque.
- 7 different models from 450 Nm up to 48600 Nm torque power.
- Constantly repeated accuracy $\pm 3\%$ across the full stroke.
- $360^\circ \times 180^\circ$ multi-positional swivel quick release couplings.
- Easy replaceable square and hexagon drive adapters.
- Body shroud engraved with torque pressure chart.
- Suitable for continuous operation at maximum pressure.
- High resistance with aluminium-titanium and light body.
- 360° adjustable reaction arm with safety lock feature.

The $360^\circ \times 180^\circ$ degree swivel is free to operation with no space limitation

The new locking coupler ensures the oil keep free access

Laser with the pressure-torque table enables convenient operation

Compact design with the raw material of advanced aluminum-titanium alloy, which intensifies the strength and toughness of the fuselage comprehensively

The reaction arm with 360 degree trimming style allows placing in any support point

Select the Right Torque

Choose the right torque wrench using the rule of thumb: Loosening torque equals about 250% of tightening torque.

Torque Wrenches Hoses

Use Torque Wrench Pumps, Twin Hoses and Couplers to ensure the integrity of your hydraulic system.

Low Profile Hydraulic Torque Wrench

360°x180° swivel joint allows free operation with no space limitation.

The design of ratchet pawl overcomes the possibility of ratchet reversing, which improves work efficiency and torque accuracy.

Integral lengthening design, longer arm and higher reliability.

Hollow design, the wrench works on nut directly, more accurate torque.

120	175	2030	19894	3050	29890						

- This is Germany standard (DIN) above,the figure in the form is the max torque of the bolt,and the recommended torque is 80% of chart figure
- The recommended tightening torque equals the figure in the form*(80~90%).For instance :M52,strength grade is 8.8,the torque is $4704*90\%=4233.6\text{N.m}$
- It is recommended that loosening torque equals about 150% of tightening torque.For instance,the tightening torque is $4233.6*(1.5\sim2)=6350.4\sim8467.2\text{N.m}$

The Space

Because of the space restriction,please notice the location. For example:

If you meet the above conditions, the square driven Torque Wrench cannot be used., you may use the Low Profile Wrench.

**BARTON
TOOLS**

Electric Hydraulic Torque Wrench Pump

Characteristics:

- Compact 3-stage pump for operation with hydraulic wrenches.
- One pump drives two hydraulic wrenches (standard setup).
- Aluminum tank and oil level indicator.
- Oil cooler for continuous operation.
- Infinitely variable pressure adjustment between 40-800 bar.

Aluminum frame for easy carrying and protecting the elements

Oil cooler permits 24 hours' uninterrupted running

Solenoid valve

Oil level indicator

External pressure adjustor
Built-in pressure relief valve

Aluminum tank for reduced weight and added portability

Long hose enables remote control

Pump and Torque Wrench setup

6 meter twin hoses with couplers

1. Hydraulic torque wrench pump 2. Hydraulic twin hose 3. Quick couplings (male + female) 4. Hydraulic wrench

Benefits Compact and lightweight design.
Convenient external pressure adjustor
Proven high quality solenoid valve and plunger piston

Model	Working pressure	Power rating	Flow at low pressure stage	Flow at high pressure stage	Voltage	Frequency	Oil Capacity	Packing size (mm)	G.W
EMP-204	700 bar	1.1KW	8L/min	0.8 L/min	220 V	50 hz	8 Liters	480x355x555 mm	43 kg
EMP-304	700 bar	1.1KW	8L/min	0.8 L/min	220 V	50 hz	8 Liters	480x385x600 mm	51 kg

Electric Hydraulic Torque Wrench Pump, HHB-6LC

Characteristics:

- Compact 3-stage pump for operation with hydraulic wrenches.
- One pump drives two hydraulic wrenches (standard setup).
- Aluminum tank and oil level indicator.
- Oil cooler for continuous operation.
- Infinitely variable pressure adjustment between 40-800 bar.

BOLTING TOOLS TENSION TIGHTENING

**BARTON
TOOLS**

Tension Tightening

Tensioning is axially stretching the bolt to achieve preload. Inaccuracies created through friction are eliminated. Massive mechanical effort to create torque is replaced with simple hydraulic pressure. A uniform load can be applied by tensioning multiple studs simultaneously. Tensioning requires longer bolts, and a seating area on the assembly around the nut.

Preload (residual load) = Applied Load minus Load Losses

What is Load Loss?

Load loss is a loss of bolt elongation depending on factors such as thread deflections, radial expansion of the nut, and embedding of the nut into the contact area of the joint. Load loss is accounted for in calculation and is added to the preload value to determine the initial Applied Load.

Tensioning Operation

Tensioning permits the simultaneous tightening of multiple bolts; the tools are connected in sequence via a high-pressure hose assembly to a single pump unit. This ensures each tool develops the exact same load and provides a uniform clamping force across the joint. This is especially important for pressure containing vessels requiring even gasket compression to affect a seal.

INCORRECT

CORRECT

The change bushing of the bolt tensioning cylinder is threaded onto the projecting thread. The turning sleeve encloses the nut.

The desired pressure is generated by an external high pressure pump. This creates an elongation in the bolt. The pressure is calculated beforehand using the initial tensioning force of the bolt and the effective piston surface.

When the pressure has been achieved, the nut is threaded onto the support surface without friction by the turning sleeve. The bolt tensioning cylinder can be removed once the pressure is released.

80%

Manufacturer's rating of pressure and torque are maximum safe limits. Good practice encourages using only 80% of these ratings!

Two-stage Bolt Tensioners

HHLS-TT36

Max working pressure: 1500bar
Specially designed for wind generator set
Two-stage cylinder design with smaller outside diameter

Characteristics:

- Two-stage cylinder design increases the tensioning length.
- Made of special high strength steel, rust-proof and corrosion resistant surface treatment.
- Smaller outside diameter permits use in narrow space .
- Spring return and overtravel protection suits frequent operation.
- Operated by ultra-high pressure hand pump or electric pump.

Model	Max working pressure (Bar)	Load capacity (KN)	Stroke (mm)	Effective area (cm ²)	Number of load cells	Thread size	A/F	Closed height (mm)	Outside diameter (mm)
HHLS-TT36	1500	728	8	49.5	2	M36×4	55	379	88
HHLS-TT42	1500	878	10	59.7	2	M42×4.5	65	273	98
HHLS-TT48	1500	1148	10	78.2	2	M48×5	75	299	111

P.S.: The above bolt tensioners were tailored to customer's needs for bolt quality 10.9. The specifications are for your reference only. Please contact TLP if you need Bolt Tensioner suits to your needs.

Ultra-high Pressure Hand Pumps

Max working pressure: 2000bar
Hydraulic bolt tensioner pumps

Characteristics:

- Lightweight and portable high-pressure hand pump.
- Two-speed operation displaces a larger volume of oil per stroke, reducing cycle times for many testing applications.
- Built-in pressure relief valve to prevent overpressurization.
- Includes a pressure gauge, coupler and 2-meter long high pressure hose.

Model	Working pressure(bar)		Oil displacement per stroke(cc)		Output connector	Pressure gauge connector	Oil capacity (cc)	G.W. (Kg)	Packing size (cm)
	1 st stage	2 nd stage	1 st stage	2 nd stage

Electric Tensioner Pumps

Hydraulic bolt tensioner pumps

Oil reservoir: 5L

Hydraulic flow at rated pressure: 0.08-0.11L/Min

Motor: 850W

Rated pressure: 21750PSI-36250PSI (1500bar-2500bar)

Weight without oil: 39.7lb (18Kg)

Characteristics:

- 2-stage piston pump without booster
- Servo motor, lower noisy level and free maintenance
- Internal safety valve, 5% over rated pressure release automatically
- Adjustable overflow valve, easy operation to control pressure
- Ball valve system, pressure holding in limited time
- Aluminum oil tank and frame, low weight
- Double outlet quick joints from CEJN

Please contact TLP to order ultra-high pressure hoses and couplers to work with the Electric Tensioner Pumps.

Model	Rated pressure		Flow at 0 bar (L/Min)	Flow at rated pressure(L/Min)	Power supply	Noisy lever (dB)	Oil available(L)	Weight without oil(Kg)
	Bar	PSI
